

BREAK COST. NOT TAPS!

SL - TAPPING MACHINES

- Balanced parallel arm makes the tool weightless
- No arduous movements for shoulders & wrists
- No indexing
- No moving of heavy workpieces

This unique concept has been successful all over the world for over 20 years. The concept comprises the combining of a parallel arm, air motor and tapping chuck. The arm is balanced against the motor and chuck combination, Making them feather light and eliminating the risk for operator fatigue. The tapping chuck is a specially designed tap holder with a built-in torque clutch, which releases as the tap reaches the bottom, the tap is sitting in a safe grip and will not brake. Several different machine types with different capacities and sizes, for both vertical and horizontal tapping, are available. The numerous choice possibilities ensures that every machine is directly tailored to every tapping operation.
